July 19, 2012

The Honorable Kathleen Sebelius
Secretary
U.S. Department of Health and Human Services
200 Independence Ave, SW
Washington, D.C. 20201

Dear Secretary Sebelius:

The undersigned health professionals, organizations, and scientists are deeply concerned about the many harms resulting from the excessive consumption of sugary drinks, particularly among young people. Soda and other sugary drinks are the only food or beverage that has been directly linked to obesity, a major contributor to coronary heart disease, stroke, type 2 diabetes, and some cancers and a cause of psychosocial problems. Soda and other sugary drinks also cause dental cavities, the most common childhood disease, and other serious dental problems. Yet, each year, the average American drinks about 40 gallons of sugary drinks, all with little, if any, nutritional benefit. We urge you to direct the Surgeon General to prepare a Report on the health effects of sugary drinks and to issue a Call to Action to spur national efforts to reduce sugary drink consumption.

Excessive consumption of sugary drinks has devastating effects on the health of young people. One study found that each extra soft drink consumed per day was associated with a 60 percent increased risk of overweight in children. Research shows that 46 percent of two- and three-year olds consume sugary drinks each day. Alarmingly, type 2 diabetes, which used to occur primarily in middle-aged and older adults, is now becoming more common among teens, especially those who are low-income and minority. Furthermore, obesity has become a national security issue. Twenty-seven percent of America’s youth are ineligible for military service because they are overweight.

Once viewed as an occasional treat, sugary drinks have become a routine, daily beverage for tens of millions of Americans. Soda and other sugary drinks are available for sale almost everywhere. The products are aggressively marketed, especially to young consumers and minorities, in both traditional and digital media, and in event sponsorships. They are promoted as a key to happiness, acceptance, social consciousness, togetherness, and fun. The disproportionate targeting of communities of color helps perpetuate health disparities in the U.S. population.

In its May 2012 report, *Accelerating Progress in Obesity Prevention*, the Institute of Medicine recommended adopting policies and implementing practices to reduce overconsumption of soda and other sugary drinks. The following groups also support efforts to cut back the use of sugary drinks: the American Heart Association, American Medical Association, American Academy of Pediatrics, National Governors Association, National Association of Local Boards of Health, American Dental Association, American Association of Pediatric Dentistry, and the American Diabetes Association. The 2010 Dietary Guidelines for Americans advises consumers to drink water instead of sugary drinks.
A Surgeon General’s Report on the health effects of sugary drinks would evaluate the science on this issue, appraise the health damaging effects, present all the facts and alert health professionals, health officials, federal food assistance program personnel, and consumers to the serious threat. The report could address the specific ingredients of sugary drinks: the biology, pharmacology, and physiological effects of sugars; addictive mechanisms associated with sugar use or other ingredients contained in sugary drinks; epidemiological data on consumption of these products and their health-damaging effects including obesity; trends in consumption for all age groups; and the gender, racial, and ethnic disparities in the effects of sugary drink consumption on health.

The report would pave the way for policy measures at all levels of government and for widespread voluntary actions in the private sector to improve health and reduce health care costs. An accompanying Surgeon General’s Call to Action to reduce consumption of sugary drinks could establish goals for federal, state, and local governments including federal food assistance programs, as well as for other public and private entities.

Consumption of sodas and sugary drinks has declined somewhat in recent years, but is still dangerously high. Unless intake of those beverages is substantially reduced, the health, economic, and psychosocial costs of obesity will continue to rise, imposing unsustainable burdens on our country. Now is the time to take effective action. Much as the 1964 Surgeon General’s Report on Smoking and Health focused national attention on the harms of tobacco use, Americans now need a wake-up call with regard to the impact of sugary drink consumption on the health, economy, and national security of our country.

Thank you for your consideration of this important matter. We look forward to receiving your response.

cc: Surgeon General Regina Benjamin
